OBJECTIVE

To obtain a graduate degree and perform research relevant to Materials Science and Engineering in order to develop my technical and managerial skills toward academia and make significant contributions to Duke University.

EDUCATION

<i>Doctor of Philosophy</i>	2013–Present	Duke University GPA: 3.7/4.0 · Department: Mechanical Engineering and Materials Science Thesis: <i>Advanced Techniques in High-Throughput Computational Materials Science</i> Advisor: Stefano Curtarolo
<i>Bachelor of Science</i>	2009–2013	Cornell University GPA: 3.3/4.0 · Department: Applied and Engineering Physics Thesis: <i>Plume Propagation Simulation for Pulsed Laser Deposition</i> Advisor: Joel Brock
<i>High School Diploma</i>	2005–2009	Bloomfield High School GPA: 3.9/4.0 · <i>Graduated fifth in class of 428</i>

RESEARCH

<i>Duke University</i>	2015–2018	Advanced Techniques in High-Throughput Computational Materials Science Advisor: Stefano Curtarolo
<i>Duke University</i>	2014–2016	Modeling Off-Stoichiometry Materials Developed and implemented a robust framework for modeling off-stoichiometry and aperiodic materials in a high-throughput fashion. <ul style="list-style-type: none">• Presented at APS March Meeting 2016. Advisor: Stefano Curtarolo
<i>Duke University</i>	2014	Materials Cartography Developed novel fingerprinting method for electronic properties of materials that enabled the construction of similarity maps. · Collaborative effort between UNC-Chapel Hill and Duke University. <ul style="list-style-type: none">• Presented at BYU Condensed Matter Physics Seminar — February 18, 2016.• Presented at Duke MEMS Department Graduate Student Seminar — September 25, 2015.• Presented at APS March Meeting 2015. Advisor: Stefano Curtarolo

Fall 2012– **Plume Propagation Simulation for Pulsed Laser Deposition**
Spring 2013

*Cornell
University*

Developed a robust, three-dimensional Monte-Carlo simulation of the Pulsed Laser Deposition material growth technique used at the Cornell High Energy Synchrotron Source.

- Presented at NSF / AAAS / EHR Emerging Researchers National Conference 2014.
- Technical poster presentation, MRS / ASM / AVS / AReMS Meeting at NC State University — November 15, 2013.
- [Technical Poster and Paper Finalist](#), SHPE Conference 2013.
- [Best Presentation Award](#), Duke MEMS Department Retreat 2013.

Advisor: Joel Brock

Summer 2012 **Synchrotron Radiation Focusing Optics — Capillary Beam Stop Design**

*Cornell High
Energy
Synchrotron
Source*

Designed and implemented a beam stop assembly to eliminate parasitic X-Ray beams and improve focusing capabilities of the ellipsoidal glass capillary optic.

- [First Place in Nanoscience and Physics Research Presentation](#), NSF / AAAS / EHR Emerging Researchers National Conference 2013.
- Technical poster and research presentation, Cornell University LSAMP Research Symposium — August 7, 2012.

Advisors: Ernest Fontes & Rong Huang

Fall 2011– **Conductivity Behavior in Strontium Titanate**
Spring 2012

*Cornell
University*

Developed and supported a model that characterizes the conductivity of annealed Strontium Titanate samples. · Further investigated conductivity behavior of annealed Strontium Titanate samples under varying electric potentials.

Advisor: Joel Brock

2009–2011 **Cornell University Autonomous Flight Team**

*Cornell
University*

Constructed an autonomous plane with capabilities to navigate waypoints, survey areas, and retrieve visual information about the surfaces below as part of a team effort for AUVSI's (Association for Unmanned Vehicle Systems International) Student Unmanned Air Systems Competition.

- Served as [team's safety officer](#) and [head system manager](#), AUVSI Student Unmanned Air System (SUAS) 2010 Competition.
- [Won a \\$1,000 grant](#), AUVSI Student Unmanned Air System (SUAS) 2010 Competition.

Advisor: Ashutosh Saxena

2009–2010 **Meinig Family Cornell National Scholars**

*Cornell
University*

Collaborated with MFCNS, scholarship fund director, and the Cornell Alumni Association for the 2009–2010 annual research project, Academic Integrity, culminating with group presentation and discussion with relevant Cornell faculty and professors.

Advisor: Kristine M. DeLuca

TEACHING EXPERIENCE

Fall 2014– ME 221: Structure and Properties of Solids, Duke University
Spring 2015

Teaching
Assistant

Introduction to materials science and engineering, emphasizing the relationships between the structure of a solid and its properties. Atomic and molecular origins of electrical, mechanical, and chemical behavior are treated in some detail for metals, alloys, polymers, ceramics, glasses, and composite materials.

- [Best Teaching Assistant Award](#), Spring 2015

Universal Fragment Descriptors for Predicting Electronic Properties of Inorganic Crystals

Authors: Olexandr Isayev, [Corey Oses](#), Stefano Curtarolo & Alexander Tropsha

Submitted

Abstract: Historically, materials discovery is driven by a laborious trial-and-error process. The growth of materials databases and emerging informatics approaches finally offer the opportunity to transform this practice into data- and knowledge-driven rational design-accelerating discovery of novel materials exhibiting desired properties. By using data from the AFLOW repository for high-throughput ab-initio calculations, we have generated Quantitative Materials Structure-Property Relationship (QMSPR) models to predict three critical material properties, namely the metal/insulator classification, Fermi energy, and band gap energy. The prediction accuracy obtained with these QMSPR models approaches training data for virtually any stoichiometric inorganic crystalline material. We attribute the success and universality of these models to the construction of new material descriptors-referred to as the universal property-labeled material fragments (PLMF). This representation affords straightforward model interpretation in terms of simple heuristic design rules that could guide rational materials design. This proof-of-concept study demonstrates the power of materials informatics to dramatically accelerate the search for new materials.

High throughput thermal conductivity of high temperature solid phases: The case of oxide and fluoride perovskites

Authors: Ambroise van Roekeghem, Jesús Carrete, [Corey Oses](#), Stefano Curtarolo & Natalio Mingo

Submitted

Abstract: Using finite-temperature phonon calculations and machine-learning methods, we calculate the mechanical stability of about 400 semiconducting oxides and fluorides with cubic perovskite structures at 0 K, 300 K and 1000 K. We find 92 mechanically stable compounds at high temperatures — including 36 not mentioned in the literature so far — for which we calculate the thermal conductivity. We demonstrate that the thermal conductivity is generally smaller in fluorides than in oxides, largely due to a lower ionic charge, and describe simple structural descriptors that are correlated with its magnitude. Furthermore, we show that the thermal conductivities of most cubic perovskites decrease more slowly than the usual T^{-1} behavior. Within this set, we also screen for materials exhibiting negative thermal expansion. Finally, we describe a strategy to accelerate the discovery of mechanically stable compounds at high temperatures.

Combining the AFLOW GIBBS and Elastic Libraries for efficiently and robustly screening thermo-mechanical properties of solids

A computational high-throughput search for new ternary superalloys

Authors: Chandramouli Nyshadham, [Corey Oses](#), Jacob E. Hansen, Ichiro Takeuchi, Stefano Curtarolo & Gus L. W. Hart

Submitted

Abstract: In 2006, a novel cobalt-based superalloy was discovered [?] with mechanical properties better than some conventional nickel-based superalloys. As with conventional superalloys, its high performance arises from the precipitate-hardening effect of a coherent L1₂ phase, which is in two-phase equilibrium with the fcc matrix. Inspired by this unexpected discovery of an L1₂ ternary phase, we performed a first-principles search through 2224 ternary metallic systems for analogous precipitate-hardening phases of the form X₃[A_{0.5}, B_{0.5}], where X = Ni, Co, or Fe, and [A, B] = Li, Be, Mg, Al, Si, Ca, Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Sr, Y, Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Hf, Ta, W, Re, Os, Ir, Pt, Au, Hg, or Tl. We found 102 systems that have a smaller decomposition energy and a lower formation enthalpy than the Co₃(Al, W) superalloy. They have a stable two-phase equilibrium with the host matrix within the concentration range $0 < x < 1$ (X₃[A_x, B_{1-x}]) and have a relative lattice mismatch with the host matrix of less than or equal to 5%. These new candidates, narrowed from 2224 systems, suggest possible experimental exploration for identifying new superalloys. Of these 102 systems, 37 are new; they have no reported phase diagrams in standard databases. Based on cost, experimental difficulty, and toxicity, we limit these 37 to a shorter list of six promising candidates of immediate interest. Our calculations are consistent with current experimental literature where data exists.

Modeling Off-Stoichiometry Materials with a High-Throughput Ab-Initio Approach Chem. Mater. **28**(18), 6484–6492 (2016)

Chemistry of
Materials

Authors: Kesong Yang, [Corey Oses](#) & Stefano Curtarolo

Abstract: Predicting material properties of off-stoichiometry systems remains a long-standing and formidable challenge in rational materials design. A proper analysis of such systems by means of a supercell approach requires the exhaustive consideration of all possible superstructures, which can be a time-consuming process. On the contrary, the use of quasirandom approximants, although very computationally effective, implicitly bias the analysis toward disordered states with the lowest site correlations. Here, we propose a novel framework designed specifically to investigate stoichiometrically driven trends of disordered systems (i.e., having partial occupation and/or disorder in the atomic sites). At the heart of the approach is the identification and analysis of unique supercells of a virtually equivalent stoichiometry to the disordered material. We employ Boltzmann statistics to resolve system-wide properties at a high-throughput (HT) level. To maximize efficiency and accessibility, we integrated the method within the automatic HT computational framework AFLOW. As proof of concept, we apply our approach to three systems of interest, a zinc chalcogenide (ZnS_{1-x}Se_x), a wide-gap oxide semiconductor (Mg_xZn_{1-x}O), and an iron alloy (Fe_{1-x}Cu_x), at various stoichiometries. These systems exhibit properties that are highly tunable as a function of composition, characterized by optical bowing and linear ferromagnetic behavior. Not only are these qualities successfully predicted, but additional insight into underlying physical mechanisms is revealed.

The AFLOW Standard for High-Throughput Materials Science Calculations
Comput. Mater. Sci. **108A**, 233–238 (2015)

Authors: Camilo E. Calderon, Jose J. Plata, Cormac H. Toher, [Corey Oses](#), Ohad Levy, Marco Fornari, Amir Natan, Michael J. Mehl, Gus L. W. Hart, Marco Buongiorno Nardelli & Stefano Curtarolo

Abstract: The Automatic-Flow (AFLOW) standard for the high-throughput construction of materials science electronic structure databases is described. Electronic structure calculations of solid state materials depend on a large number of parameters which must be understood by researchers, and must be reported by originators to ensure reproducibility and enable collaborative database expansion. We therefore describe standard parameter values for k-point grid density, basis set plane wave kinetic energy cut-off, exchange-correlation functionals, pseudopotentials, DFT+U parameters, and convergence criteria used in AFLOW calculations.

Materials Cartography: Representing and Mining Materials Space Using Structural and Electronic Fingerprints

Chem. Mater. **27**(3), 735–743 (2015)

Authors: Olexandr Isayev, Denis Fourches, Eugene N. Muratov, [Corey Oses](#), Kevin M. Rasch, Alexander Tropsha & Stefano Curtarolo

Abstract: As the proliferation of high-throughput approaches in materials science is increasing the wealth of data in the field, the gap between accumulated-information and derived-knowledge widens. We address the issue of scientific discovery in materials databases by introducing novel analytical approaches based on structural and electronic materials fingerprints. The framework is employed to (i) query large databases of materials using similarity concepts, (ii) map the connectivity of materials space (i.e., as a materials cartograms) for rapidly identifying regions with unique organizations / properties, and (iii) develop predictive Quantitative Materials Structure-Property Relationship models for guiding materials design. In this study, we test these fingerprints by seeking target material properties. As a quantitative example, we model the critical temperatures of known superconductors. Our novel materials fingerprinting and materials cartography approaches contribute to the emerging field of materials informatics by enabling effective computational tools to analyze, visualize, model, and design new materials.
