## PERSONAL INFORMATION

*email*                      [corey.oses@duke.edu](mailto:corey.oses@duke.edu)  
*website*                  <http://www.coreyoses.com>  
*phone*                    (M) +1 (201) 674 1407 · (W) +1 (919) 684 1553

## OBJECTIVE

To obtain a graduate degree and perform research relevant to Materials Science and Engineering in order to develop my technical and managerial skills toward academia and make significant contributions to Duke University.

## EDUCATION

	<i>2013–Present</i>	Duke University
<i>Ph.D. Candidate</i>	GPA: 3.8/4.0 · Department: Mechanical Engineering and Materials Science	
	Thesis: <i>Advanced Techniques in High-Throughput Computational Materials Science</i>	
	<b>Advisor:</b> Stefano Curtarolo	
	<i>2009–2013</i>	Cornell University
<i>Bachelor of Science</i>	GPA: 3.3/4.0 · Department: Applied and Engineering Physics	
	Thesis: <i>Plume Propagation Simulation for Pulsed Laser Deposition</i>	
	<b>Advisor:</b> Joel Brock	
	<i>2005–2009</i>	Bloomfield High School
<i>High School Diploma</i>	GPA: 3.9/4.0 · Graduated fifth in class of 428	

## RESEARCH

	<i>2015–2018</i>	Advanced Techniques in High-Throughput Computational Materials Science
<i>Duke University</i>	Implemented algorithms for the analysis of partial charge, vibrational modes, and mechanical and thermodynamic stability. · Developed predictive models and novel materials discovery abstractions, such as Materials Cartography, toward the goal of rational materials design. · <b>Focus:</b> Full implementation of the AFLOW Superconductivity Library (ASL), which, given any material structure, will perform all necessary analyses needed for the calculation of the superconductivity critical temperature under the Allen-Dynes modified McMillan formulation in an automatic, high-throughput fashion.	
	• Completed Preliminary Defense — June 24, 2016.	
	<b>Committee Members:</b> Stefano Curtarolo, Cormac H. Toher, Laurens E. Howle & Gus L. W. Hart

	<i>Fall 2011– Spring 2012</i>	Conductivity Behavior in Strontium Titanate
Cornell University		Verified a model that characterizes the conductivity of annealed Strontium Titanate samples. · Further investigated conductivity behavior of annealed Strontium Titanate samples under varying electric potentials. <b>Advisor:</b> Joel Brock
	<i>2009–2011</i>	Cornell University Autonomous Flight Team
		Constructed an autonomous plane with capabilities to navigate waypoints, survey areas, and retrieve visual information about the surfaces below as part of a team effort for AUVSI's (Association for Unmanned Vehicle Systems International) Student Unmanned Air Systems Competition.
Cornell University		<ul style="list-style-type: none"> <li>Served as <a href="#">team's safety officer</a> and <a href="#">head systems manager</a>, AUVSI Student Unmanned Air System (SUAS) 2010 Competition.</li> <li><a href="#">Won a \$1,000 grant</a>, AUVSI Student Unmanned Air System (SUAS) 2010 Competition.</li> </ul> <b>Advisor:</b> Ashutosh Saxena
	<i>2009–2010</i>	Meinig Family Cornell National Scholars
Cornell University		Collaborated with MFCNS, scholarship fund director, and the Cornell Alumni Association for the 2009–2010 annual research project, Academic Integrity, culminating with group presentation and discussion with relevant Cornell faculty and professors. <b>Advisor:</b> Kristine M. DeLuca

## TEACHING EXPERIENCE

	<i>Fall 2014– Spring 2015</i>	ME 221: Structure and Properties of Solids, Duke University
Teaching Assistant		Introduction to materials science and engineering, emphasizing the relationships between the structure of a solid and its properties. Atomic and molecular origins of electrical, mechanical, and chemical behavior are treated in some detail for metals, alloys, polymers, ceramics, glasses, and composite materials. <ul style="list-style-type: none"> <li><a href="#">Best Teaching Assistant Award</a>, Spring 2015</li> </ul>

## WORK EXPERIENCE AND SKILLS

Proficient Coder	Present	Python, $\text{\LaTeX}$ , C++, MATLAB & R
Graduate	September 2017	NextProf Workshop at the University of Michigan
Graduate	January 2015	Machine Learning Summer School at the University of Texas, Austin
Internship	Summer 2013	Cornell High Energy Synchrotron Source (BioSAXS on F2 and G Beamlines) <b>Supervisors:</b> Richard Edward Gillilan & Ernest Fontes
Graduate	May 2011	The LeaderShape Institute
Student Employee	Summer 2011	ILR Budget Office, Cornell University <b>Supervisor:</b> Renee Laree Monroe

<i>Technician License</i>	July 2010	American Radio Relay League (ARRL)
<i>Externship</i>	March 2010	Supreme Court of New York <b>Supervisors:</b> Ariel E. Belen & Allen Hurkin-Torres
<i>Math Tutor</i>	Fall 2008	Graduate Record Exam (GRE)
<i>Office Assistant</i>	Summer 2008	SOS Security, LLC in Parsippany, NJ <b>Supervisor:</b> James Flanagan

## ACTIVITIES AND OUTREACH

<i>Graduate Representative</i>	2015–Present	Council of Presidents, Duke Graduate School
<i>Member</i>	2014–Present	American Physical Society
<i>Graduate Student Advisor</i>	2009–Present	Society of Hispanic Professional Engineers, Duke University & Cornell University <b>Positions:</b> Graduate Student Advisor, <a href="#">President</a> , Corporate Vice President & Treasurer
<i>Distinguished Past Governor</i>	2010–2013	Circle K, Cornell University <b>Positions:</b> New York District <a href="#">Distinguished Past Governor</a> , New York District <a href="#">Distinguished Past Treasurer</a> & <a href="#">Restarting Chapter President</a> at Cornell University
<i>Member</i>	2009–2013	Meinig Family Cornell National Scholars, Cornell Commitment
<i>Mechanical Engineer</i>	2009–2011	Cornell University Autonomous Flight Team, Cornell University <b>Positions:</b> Mechanical Engineer & Safety Officer
<i>President</i>	2005–2009	Future Business Leaders of America, Bloomfield High School <b>Positions:</b> <a href="#">President</a> & General Manager of School Store
<i>Membership Director</i>	2005–2009	Key Club, Bloomfield High School <b>Positions:</b> Membership Director & Activities Director
<i>Retreat Team</i>	2005–2009	Youth Group, Saint Thomas the Apostle Church <b>Positions:</b> Retreat Team, Lead Role in <i>Stations of the Cross Performance</i> & Confirmation Class Instructor
<i>President</i>	2008–2009	Astronomy Club, Bloomfield High School
<i>Member</i>	2009	United Astronomy Clubs of New Jersey
<i>Member</i>	2009	New Jersey Astronomical Group, Montclair State University
<i>Secretary</i>	2006–2009	Model United Nations, Bloomfield High School <b>Positions:</b> Secretary & Treasurer

<i>Treasurer</i>	2006–2009	Math Team, Bloomfield High School
<i>Member</i>	2006–2009	Science Club, Bloomfield High School Physics Club · Chemistry Club
<i>Athlete</i>	2006–2009	Spring Track and Field, Bloomfield High School Javelin Junior Varsity Team
<i>Member</i>	2006–2009	Weight Lifting Team, Bloomfield High School
<i>Tutor</i>	2006–2009	Tutor at the Library, Bloomfield High School
<i>County Freeholder</i>	2008	American Legion Jersey Boys State <b>Positions:</b> County Freeholder & City Councilman
<i>Member</i>	2005–2008	Latin Club, Bloomfield High School
<i>Member</i>	2005–2006	Bowling Team, Bloomfield High School
<i>Black belt</i>	2002–2006	Tae Kwon Do, USMA in Clifton, New Jersey

<i>Award</i>	2008	Yale Book Club Award, Yale Club of Montclair, New Jersey

## JOURNAL PUBLICATIONS

### 2017

12 *AFLOW Platform for Low-Temperature Thermodynamic Phase Stability Analyses*

**Authors:** [Corey Oses](#), Eric Perim, Eric Gossett, Frisco Rose & Stefano Curtarolo

*In Preparation*

**Abstract:** Determination of thermodynamic stability plays a crucial role in any materials design initiative. We explore some of the analyses that are of particular importance to the high-throughput *ab-initio* community and present a new module for performing these calculations within the software platform AFLOW. Leveraging the AFLOW RESTful API, this module goes beyond the standard convex hull plot interface with tools and options that enable users to rapidly create and interact with thermodynamic stability data. In addition to the creation of fully functional documents, AFLOW Hull powers an online graphical interface available via the [AFLOW Online Portal](#). We hope that the adoption of such rapid post-processing frameworks will lead to the development of novel materials descriptors and, correspondingly, new functional materials.

11 *Machine learning modeling of superconducting critical temperature*

**Authors:** Valentin Stanev, [Corey Oses](#), Aaron Gilad Kusne, Efrain Rodriguez, Johnpierre Paglione, Stefano Curtarolo & Ichiro Takeuchi

*Submitted*

**Abstract:** Superconductivity has been the focus of enormous research effort since its discovery more than a century ago. Yet, some features of this unique phenomenon remain poorly understood; prime among these is the connection between superconductivity and chemical/structural properties of materials. To bridge the gap, several machine learning methods are developed herein to model the critical temperatures ( $T_c$ ) of the 12,000+ known superconductors available via the SuperCon database. Materials are first divided into two classes based on their  $T_c$ 's, above and below 10 K, and a classification model predicting this label is trained. The model uses coarse-grained features based only on the chemical compositions. It shows strong predictive power, with out-of-sample accuracy of about 92%. Separate regression models are developed to predict the values of  $T_c$  for cuprate, iron-based, and "low- $T_c$ " compounds. These models also demonstrate good performance, with learned predictors offering important insights into the mechanisms behind superconductivity in different families of materials. To improve the accuracy and interpretability of these models, new features are incorporated using materials data from the AFLOW Online Repositories. Finally, the classification and regression models are combined into a single integrated pipeline and employed to search the entire Inorganic Crystallographic Structure Database (ICSD) for potential new superconductors. We identify about 30 non-cuprate and non-iron-based oxides as candidate materials.

10 *The structure and composition statistics of 6A binary and ternary structures*

**Authors:** Alon Hever, [Corey Oses](#), Stefano Curtarolo, Ohad Levy & Amir Natan

*Submitted*

**Abstract:** The fundamental principles underlying the arrangement of the elements into solid compounds with an enormous variety of crystal structures are still largely unknown. This study presents a general overview of the structure types appearing in an important subset of the solid compounds, *i.e.*, binary and ternary compounds of the 6A column oxides, sulfides and selenides. It contains an analysis of these compounds, including the prevalence of various structure types, their symmetry properties, compositions, stoichiometries and unit cell sizes. It is found that these compound families include preferred stoichiometries and structure types, some of which have highly specific atomic compositions that may reflect both their specific chemistry and research bias in the available empirical data.

**arXiv:** [arxiv:1703.04497](#)

9 *AFLUX: The LUX materials search API for the AFLOW data repositories*  
Comput. Mater. Sci. **137**, 362–370 (2017)

**Authors:** Frisco Rose, Cormac H. Toher, Eric Gossett, [Corey Oses](#), Marco Buongiorno Nardelli, Marco Fornari & Stefano Curtarolo

**Abstract:** Automated computational materials science frameworks rapidly generate large quantities of materials data for accelerated materials design. In order to take advantage of these large databases, users should have the ability to efficiently search and extract the desired data. Therefore, we have extended the data oriented AFLOW-repository Application-Program-Interface (API) (Comput. Mater. Sci. **93**, 178 (2014)) to enable programmatic access to search queries. A Uniform Resource Identifier (URI)-based search API is proposed for the construction of complex queries for remote creation and retrieval of customized data sets. It is expected that the new language AFLUX, from Automatic Flow of LUX (light), will enable remote search operations on the AFLOW set of computational materials science data repositories. In addition, AFLUX facilitates the verification and validation of the data in the AFLOW repositories.

8 *Universal Fragment Descriptors for Predicting Properties of Inorganic Crystals*  
Nat. Commun. **8**, 15679 (2017)

**Authors:** Olexandr Isayev<sup>†</sup>, [Corey Oses](#)<sup>†</sup>, Cormac H. Toher, Eric Gossett, Stefano Curtarolo & Alexander Tropsha

<sup>†</sup> contributed equally

**Abstract:** Historically, materials discovery is driven by a laborious trial-and-error process. The growth of materials databases and emerging informatics approaches finally offer the opportunity to transform this practice into data- and knowledge-driven rational design-accelerating discovery of novel materials exhibiting desired properties. By using data from the AFLOW repository for high-throughput ab-initio calculations, we have generated Quantitative Materials Structure-Property Relationship (QMSPR) models to predict three critical material properties, namely the metal / insulator classification, Fermi energy, and band gap energy. The prediction accuracy obtained with these QMSPR models approaches training data for virtually any stoichiometric inorganic crystalline material. We attribute the success and universality of these models to the construction of new material descriptors-referred to as the universal property-labeled material fragments (PLMF). This representation affords straightforward model interpretation in terms of simple heuristic design rules that could guide rational materials design. This proof-of-concept study demonstrates the power of materials informatics to dramatically accelerate the search for new materials.

7 *Combining the AFLOW GIBBS and elastic Libraries to efficiently and robustly screening thermomechanical properties of solids*  
Phys. Rev. Mater. **1**, 015401 (2017)

**Authors:** Cormac H. Toher, [Corey Oses](#), Jose J. Plata, David J. Hicks, Frisco Rose, Ohad Levy, Maarten de Jong, Mark Asta, Marco Fornari, Marco Buongiorno Nardelli & Stefano Curtarolo

**Abstract:** Thorough characterization of the thermomechanical properties of materials requires difficult and time-consuming experiments. This severely limits the availability of data and is one of the main obstacles for the development of effective accelerated materials design strategies. The rapid screening of new potential systems requires highly integrated, sophisticated, and robust computational approaches. We tackled the challenge by developing an automated, integrated workflow with robust error-correction within the AFLOW framework which combines the newly developed “Automatic Elasticity Library” with the previously implemented GIBBS method. The first extracts the mechanical properties from automatic self-consistent stress-strain calculations, while the latter employs those mechanical properties to evaluate the thermodynamics within the Debye model. The new thermoelastic library is benchmarked against a set of 74 experimentally characterized systems to pinpoint a robust computational methodology for the evaluation of bulk and shear moduli, Poisson ratios, Debye temperatures, Grüneisen parameters, and thermal conductivities of a wide variety of materials. The effect of different choices of equations of state and exchange-correlation functionals is examined and the optimum combination of properties for the Leibfried-Schlömann prediction of thermal conductivity is identified, leading to improved agreement with experimental results than the GIBBS-only approach. The framework has been applied to the AFLOW.org data repositories to compute the thermoelastic properties of over 3500 unique materials. The results are now available online by using an expanded version of the REST-API described in the Appendix.

6 *A Computational High-Throughput Search for New Ternary Superalloys*  
Acta Mater. **122**, 438–447 (2017)

**Authors:** Chandramouli Nyshadham, [Corey Oses](#), Jacob E. Hansen, Ichiro Takeuchi, Stefano Curtarolo & Gus L. W. Hart

**Abstract:** In 2006, a novel cobalt-based superalloy was discovered with mechanical properties better than some conventional nickel-based superalloys. As with conventional superalloys, its high performance arises from the precipitate-hardening effect of a coherent  $L1_2$  phase, which is in two-phase equilibrium with the fcc matrix. Inspired by this unexpected discovery of an  $L1_2$  ternary phase, we performed a first-principles search through 2224 ternary metallic systems for analogous precipitate-hardening phases of the form  $X_3[A_{0.5}, B_{0.5}]$ , where  $X = \text{Ni, Co, or Fe}$ , and  $[A, B] = \text{Li, Be, Mg, Al, Si, Ca, Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Sr, Y, Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Hf, Ta, W, Re, Os, Ir, Pt, Au, Hg, or Tl}$ . We found 102 systems that have a smaller decomposition energy and a lower formation enthalpy than the  $\text{Co}_3(\text{Al, W})$  superalloy. They have a stable two-phase equilibrium with the host matrix within the concentration range  $0 < x < 1$  ( $X_3[A_x, B_{1-x}]$ ) and have a relative lattice mismatch with the host matrix of less than or equal to 5%. These new candidates, narrowed from 2224 systems, suggest possible experimental exploration for identifying new superalloys. Of these 102 systems, 37 are new; they have no reported phase diagrams in standard databases. Based on cost, experimental difficulty, and toxicity, we limit these 37 to a shorter list of six promising candidates of immediate interest. Our calculations are consistent with current experimental literature where data exists.

5 *Accelerated Discovery of New Magnets in the Heusler Alloy Family*  
Sci. Adv. **3**(4), e1602241 (2017)

**Authors:** Stefano Sanvito, [Corey Oses](#), Junkai Xue, Anurag Tiwari, Mario Zic, Thomas Archer, Pelin Tozman, Munuswamy Venkatesan, J. Michael D. Coey & Stefano Curtarolo

**Abstract:** Magnetic materials underpin modern technologies, ranging from data storage to energy conversion to contactless sensing. However, the development of a new high-performance magnet is a long and often unpredictable process, and only about two dozen feature in mainstream applications. We describe a systematic pathway to the design of novel magnetic materials, which demonstrates a high throughput and discovery speed. On the basis of an extensive electronic structure library of Heusler alloys containing 236,115 prototypical compounds, we filtered those alloys displaying magnetic order and established whether they can be fabricated at thermodynamical equilibrium. Specifically, we carried out a full stability analysis of intermetallic Heusler alloys made only of transition metals. Among the possible 36,540 prototypes, 248 were thermodynamically stable but only 20 were magnetic. The magnetic ordering temperature,  $T_C$ , was estimated by a regression calibrated on the experimental  $T_C$  of about 60 known compounds. As a final validation, we attempted the synthesis of a few of the predicted compounds and produced two new magnets:  $\text{Co}_2\text{MnTi}$ , which displays a remarkably high  $T_C$  in perfect agreement with the predictions, and  $\text{Mn}_2\text{PtPd}$ , which is an antiferromagnet. Our work paves the way for large-scale design of novel magnetic materials at potentially high speed.

4 *High-Throughput Computation of Thermal Conductivity of High-Temperature Solid Phases: The Case of Oxide and Fluoride Perovskites*  
Phys. Rev. X **6**(4), 041061 (2016)

**Authors:** Ambroise van Roekeghem, Jesús Carrete, [Corey Oses](#), Stefano Curtarolo & Natalio Mingo

**Abstract:** Using finite-temperature phonon calculations and machine-learning methods, we assess the mechanical stability of about 400 semiconducting oxides and fluorides with cubic perovskite structures at 0, 300, and 1000 K. We find 92 mechanically stable compounds at high temperatures — including 36 not mentioned in the literature so far — for which we calculate the thermal conductivity. We show that the thermal conductivity is generally smaller in fluorides than in oxides, largely due to a lower ionic charge, and describe simple structural descriptors that are correlated with its magnitude. Furthermore, we show that the thermal conductivities of most cubic perovskites decrease more slowly than the usual  $T^{-1}$  behavior. Within this set, we also screen for materials exhibiting negative thermal expansion. Finally, we describe a strategy to accelerate the discovery of mechanically stable compounds at high temperatures.

**Abstract:** Predicting material properties of off-stoichiometry systems remains a long-standing and formidable challenge in rational materials design. A proper analysis of such systems by means of a supercell approach requires the exhaustive consideration of all possible superstructures, which can be a time-consuming process. On the contrary, the use of quasirandom approximants, although very computationally effective, implicitly bias the analysis toward disordered states with the lowest site correlations. Here, we propose a novel framework designed specifically to investigate stoichiometrically driven trends of disordered systems (*i.e.*, having partial occupation and/or disorder in the atomic sites). At the heart of the approach is the identification and analysis of unique supercells of a virtually equivalent stoichiometry to the disordered material. We employ Boltzmann statistics to resolve system-wide properties at a high-throughput (HT) level. To maximize efficiency and accessibility, we integrated the method within the automatic HT computational framework AFLOW. As proof of concept, we apply our approach to three systems of interest, a zinc chalcogenide ( $\text{ZnS}_{1-x}\text{Se}_x$ ), a wide-gap oxide semiconductor ( $\text{Mg}_x\text{Zn}_{1-x}\text{O}$ ), and an iron alloy ( $\text{Fe}_{1-x}\text{Cu}_x$ ), at various stoichiometries. These systems exhibit properties that are highly tunable as a function of composition, characterized by optical bowing and linear ferromagnetic behavior. Not only are these qualities successfully predicted, but additional insight into underlying physical mechanisms is revealed.

**Abstract:** The Automatic-Flow (AFLOW) standard for the high-throughput construction of materials science electronic structure databases is described. Electronic structure calculations of solid state materials depend on a large number of parameters which must be understood by researchers, and must be reported by originators to ensure reproducibility and enable collaborative database expansion. We therefore describe standard parameter values for k-point grid density, basis set plane wave kinetic energy cut-off, exchange-correlation functionals, pseudopotentials, DFT+U parameters, and convergence criteria used in AFLOW calculations.

**Abstract:** As the proliferation of high-throughput approaches in materials science is increasing the wealth of data in the field, the gap between accumulated-information and derived-knowledge widens. We address the issue of scientific discovery in materials databases by introducing novel analytical approaches based on structural and electronic materials fingerprints. The framework is employed to (i) query large databases of materials using similarity concepts, (ii) map the connectivity of materials space (*i.e.*, as a materials cartograms) for rapidly identifying regions with unique organizations / properties, and (iii) develop predictive Quantitative Materials Structure-Property Relationship models for guiding materials design. In this study, we test these fingerprints by seeking target material properties. As a quantitative example, we model the critical temperatures of known superconductors. Our novel materials fingerprinting and materials cartography approaches contribute to the emerging field of materials informatics by enabling effective computational tools to analyze, visualize, model, and design new materials.
