OBJECTIVE

To obtain a graduate degree and perform research relevant to Materials Science and Engineering in order to develop my technical and managerial skills toward academia and make significant contributions to Duke University.

EDUCATION

<i>Doctor of Philosophy</i>	2013–Present	Duke University GPA: 3.7/4.0 · Department: Mechanical Engineering and Materials Science Thesis: <i>Advanced Techniques in High-Throughput Computational Materials Science</i> Advisor: Stefano Curtarolo
<i>Bachelor of Science</i>	2009–2013	Cornell University GPA: 3.3/4.0 · Department: Applied and Engineering Physics Thesis: <i>Plume Propagation Simulation for Pulsed Laser Deposition</i> Advisor: Joel Brock
<i>High School Diploma</i>	2005–2009	Bloomfield High School GPA: 3.9/4.0 · <i>Graduated fifth in class of 428</i>

RESEARCH

<i>Duke University</i>	2015–2018	Advanced Techniques in High-Throughput Computational Materials Science Advisor: Stefano Curtarolo
<i>Duke University</i>	2014–2016	Modeling Off-Stoichiometry Materials Developed and implemented a robust framework for modeling off-stoichiometry and aperiodic materials in a high-throughput fashion. <ul style="list-style-type: none">• Presented at APS March Meeting 2016. Advisor: Stefano Curtarolo
<i>Duke University</i>	2014	Materials Cartography Developed novel fingerprinting method for electronic properties of materials that enabled the construction of similarity maps. · Collaborative effort between UNC-Chapel Hill and Duke University. <ul style="list-style-type: none">• Presented at BYU Condensed Matter Physics Seminar — February 18, 2016.• Presented at Duke MEMS Department Graduate Student Seminar — September 25, 2015.• Presented at APS March Meeting 2015. Advisor: Stefano Curtarolo

Fall 2012– **Plume Propagation Simulation for Pulsed Laser Deposition**
Spring 2013

*Cornell
University*

Developed a robust, three-dimensional Monte-Carlo simulation of the Pulsed Laser Deposition material growth technique used at the Cornell High Energy Synchrotron Source.

- Presented at NSF / AAAS / EHR Emerging Researchers National Conference 2014.
- Technical poster presentation, MRS / ASM / AVS / AReMS Meeting at NC State University — November 15, 2013.
- [Technical Poster and Paper Finalist](#), SHPE Conference 2013.
- [Best Presentation Award](#), Duke MEMS Department Retreat 2013.

Advisor: Joel Brock

Summer 2012 **Synchrotron Radiation Focusing Optics — Capillary Beam Stop Design**

*Cornell High
Energy
Synchrotron
Source*

Designed and implemented a beam stop assembly to eliminate parasitic X-Ray beams and improve focusing capabilities of the ellipsoidal glass capillary optic.

- [First Place in Nanoscience and Physics Research Presentation](#), NSF / AAAS / EHR Emerging Researchers National Conference 2013.
- Technical poster and research presentation, Cornell University LSAMP Research Symposium — August 7, 2012.

Advisors: Ernest Fontes & Rong Huang

Fall 2011– **Conductivity Behavior in Strontium Titanate**
Spring 2012

*Cornell
University*

Developed and supported a model that characterizes the conductivity of annealed Strontium Titanate samples. · Further investigated conductivity behavior of annealed Strontium Titanate samples under varying electric potentials.

Advisor: Joel Brock

2009–2011 **Cornell University Autonomous Flight Team**

*Cornell
University*

Constructed an autonomous plane with capabilities to navigate waypoints, survey areas, and retrieve visual information about the surfaces below as part of a team effort for AUVSI's (Association for Unmanned Vehicle Systems International) Student Unmanned Air Systems Competition.

- Served as [team's safety officer](#) and [head system manager](#), AUVSI Student Unmanned Air System (SUAS) 2010 Competition.
- [Won a \\$1,000 grant](#), AUVSI Student Unmanned Air System (SUAS) 2010 Competition.

Advisor: Ashutosh Saxena

2009–2010 **Meinig Family Cornell National Scholars**

*Cornell
University*

Collaborated with MFCNS, scholarship fund director, and the Cornell Alumni Association for the 2009–2010 annual research project, Academic Integrity, culminating with group presentation and discussion with relevant Cornell faculty and professors.

Advisor: Kristine M. DeLuca

TEACHING EXPERIENCE

	<i>Fall 2014– Spring 2015</i>	ME 221: Structure and Properties of Solids, Duke University
<i>Teaching Assistant</i>		Introduction to materials science and engineering, emphasizing the relationships between the structure of a solid and its properties. Atomic and molecular origins of electrical, mechanical, and chemical behavior are treated in some detail for metals, alloys, polymers, ceramics, glasses, and composite materials.
		<ul style="list-style-type: none"> • Best Teaching Assistant Award, Spring 2015

WORK EXPERIENCE AND SKILLS

<i>Graduate</i>	<i>January 2015</i>	Machine Learning Summer School at the University of Texas, Austin
<i>Internship</i>	<i>Summer 2013</i>	Cornell High Energy Sychrotron Source (BioSAXS on F2 and G Beamlines) Supervisors: Richard Edward Gillilan & Ernest Fontes
<i>Graduate</i>	<i>May 2011</i>	<i>The LeaderShape Institute</i>
<i>Student Employee</i>	<i>Summer 2011</i>	ILR Budget Office, Cornell University Supervisor: Renee Laree Monroe
<i>Technician License</i>	<i>July 2010</i>	American Radio Relay League (ARRL)
<i>Internship</i>	<i>March 2010</i>	Supreme Court of New York Supervisors: Ariel E. Belen & Allen Hurkin-Torres
<i>Math Tutor</i>	<i>Fall 2008</i>	Graduate Record Exam (GRE)
<i>Office Assistant</i>	<i>Summer 2008</i>	SOS Security, LLC in Parsippany, NJ Supervisor: James Flanagan
<i>Proficient Coder</i>	<i>Present</i>	Python, L ^A T _E X, C++, Matlab, & R

ACTIVITIES AND OUTREACH

<i>Member</i>	<i>2014–Present</i>	American Physical Society
<i>Graduate Student Advisor</i>	<i>2009–Present</i>	Society of Hispanic Professional Engineers Positions: Graduate Student Advisor, President , Corporate Vice President & Treasurer
<i>Distinguished Past Governor</i>	<i>2009–2013</i>	Circle K, International Positions: New York District Distinguished Past Governor , New York District Distinguished Past Treasurer & Restarting Chapter President at Cornell University
<i>Member</i>	<i>2009–2013</i>	Meinig Family Cornell National Scholars, Cornell Commitment

<i>Member</i>	2009	United Astronomy Clubs of New Jersey
<i>Member</i>	2009	New Jersey Astronomical Group
<i>President</i>	2008–2009	Astronomy Club
<i>President</i>	2005–2009	Future Business Leaders of America Positions: <i>President</i> & General Manager of School Store
<i>Membership Director</i>	2005–2009	Key Club Positions: Membership Director & Activities Director
<i>Retreat Team</i>	2005–2009	Saint Thomas the Apostle Youth Group Positions: Retreat Team, Lead Role in <i>Stations of the Cross Performance</i> & Confirmation Class Instructor
<i>Secretary</i>	2006–2009	Model United Nations Positions: Secretary & Treasurer
<i>Treasurer</i>	2006–2009	Math Team
<i>Member</i>	2006–2009	Science Club Physics Club · Chemistry Club
<i>Athlete</i>	2006–2009	Spring Track and Field Javelin Junior Varsity Team
<i>Member</i>	2006–2009	Weight Lifting Team
<i>Tutor</i>	2006–2009	Tutor at the Library
<i>Member</i>	2005–2008	Latin Club
<i>Member</i>	2005–2006	Bowling Team

The statistics of 6A non-metal binary and ternary structures — what can we learn from nature?

Authors: Alon Hever, [Corey Oses](#), Stefano Curtarolo, Ohad Levy & Amir Natan

*In
Preparation*

Abstract: The fundamental principles underlying the arrangement of the elements into solid compounds with an enormous variety of crystal structures are still largely unknown. In this study we obtain a general overview of the structure types appearing in an important subset of the solid compounds, i.e. binary and ternary compounds of the 6A column non-metals, oxides, sulfides and selenides. We present an analysis of these compounds, including the prevalence of various structure types, their symmetry properties, compositions, stoichiometries and unit cell sizes. We demonstrate that there are preferred stoichiometries and structure types. We further show that some structure types and stoichiometries have highly specific atomic compositions which may reflect both the chemistry and research bias.

Universal Fragment Descriptors for Predicting Electronic Properties of Inorganic Crystals

Authors: Olexandr Isayev, [Corey Oses](#), Stefano Curtarolo & Alexander Tropsha

Submitted

Abstract: Historically, materials discovery is driven by a laborious trial-and-error process. The growth of materials databases and emerging informatics approaches finally offer the opportunity to transform this practice into data- and knowledge-driven rational design-accelerating discovery of novel materials exhibiting desired properties. By using data from the AFLOW repository for high-throughput ab-initio calculations, we have generated Quantitative Materials Structure-Property Relationship (QMSPR) models to predict three critical material properties, namely the metal/insulator classification, Fermi energy, and band gap energy. The prediction accuracy obtained with these QMSPR models approaches training data for virtually any stoichiometric inorganic crystalline material. We attribute the success and universality of these models to the construction of new material descriptors-referred to as the universal property-labeled material fragments (PLMF). This representation affords straightforward model interpretation in terms of simple heuristic design rules that could guide rational materials design. This proof-of-concept study demonstrates the power of materials informatics to dramatically accelerate the search for new materials.

High throughput thermal conductivity of high temperature solid phases: The case of oxide and fluoride perovskites

Authors: Ambroise van Roekeghem, Jesús Carrete, [Corey Oses](#), Stefano Curtarolo & Natalio Mingo

Submitted

Abstract: Using finite-temperature phonon calculations and machine-learning methods, we calculate the mechanical stability of about 400 semiconducting oxides and fluorides with cubic perovskite structures at 0 K, 300 K and 1000 K. We find 92 mechanically stable compounds at high temperatures — including 36 not mentioned in the literature so far — for which we calculate the thermal conductivity. We demonstrate that the thermal conductivity is generally smaller in fluorides than in oxides, largely due to a lower ionic charge, and describe simple structural descriptors that are correlated with its magnitude. Furthermore, we show that the thermal conductivities of most cubic perovskites decrease more slowly than the usual T^{-1} behavior. Within this set, we also screen for materials exhibiting negative thermal expansion. Finally, we describe a strategy to accelerate the discovery of mechanically stable compounds at high temperatures.

Combining the AFLOW GIBBS and Elastic Libraries for efficiently and robustly screening thermo-mechanical properties of solids

Authors: Cormac H. Toher, [Corey Oses](#), Jose J. Plata, David J. Hicks, Frisco Rose, Ohad Levy, Maarten de Jong, Mark Asta, Marco Fornari, Marco Buongiorno Nardelli & Stefano Curtarolo

Submitted

Abstract: Thorough characterization of the thermo-mechanical properties of materials requires difficult and time-consuming experiments. This severely limits the availability of data and it is one of the main obstacles for the development of effective accelerated materials design strategies. The rapid screening of new potential systems requires highly integrated, sophisticated and robust computational approaches. We tackled the challenge by surveying more than 3,000 crystalline solids within the AFLOW framework with the newly developed “Automatic Elasticity Library” combined with the previously implemented GIBBS method. The first extracts the mechanical properties from automatic self-consistent stress-strain calculations, while the latter employs those mechanical properties to evaluate the thermodynamics within the Debye model. The new thermo-elastic library is benchmarked against a set of 74 experimentally characterized systems to pinpoint a robust computational methodology for the evaluation of bulk and shear moduli, Poisson ratios, Debye temperatures, Grüneisen parameters, and thermal conductivities of a wide variety of materials. The effect of different choices of equations of state is examined and the optimum combination of properties for the Leibfried-Schlömann prediction of thermal conductivity is identified, leading to improved agreement with experimental results than the GIBBS-only approach.

A computational high-throughput search for new ternary superalloys
Acta Mater. in press (2016)

Authors: Chandramouli Nyshadham, [Corey Oses](#), Jacob E. Hansen, Ichiro Takeuchi, Stefano Curtarolo & Gus L. W. Hart

Abstract: In 2006, a novel cobalt-based superalloy was discovered with mechanical properties better than some conventional nickel-based superalloys. As with conventional superalloys, its high performance arises from the precipitate-hardening effect of a coherent L1₂ phase, which is in two-phase equilibrium with the fcc matrix. Inspired by this unexpected discovery of an L1₂ ternary phase, we performed a first-principles search through 2224 ternary metallic systems for analogous precipitate-hardening phases of the form X₃[A_{0.5}, B_{0.5}], where X = Ni, Co, or Fe, and [A, B] = Li, Be, Mg, Al, Si, Ca, Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Sr, Y, Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Hf, Ta, W, Re, Os, Ir, Pt, Au, Hg, or Tl. We found 102 systems that have a smaller decomposition energy and a lower formation enthalpy than the Co₃(Al, W) superalloy. They have a stable two-phase equilibrium with the host matrix within the concentration range 0 < x < 1 (X₃[A_x, B_{1-x}]) and have a relative lattice mismatch with the host matrix of less than or equal to 5%. These new candidates, narrowed from 2224 systems, suggest possible experimental exploration for identifying new superalloys. Of these 102 systems, 37 are new; they have no reported phase diagrams in standard databases. Based on cost, experimental difficulty, and toxicity, we limit these 37 to a shorter list of six promising candidates of immediate interest. Our calculations are consistent with current experimental literature where data exists.

Modeling Off-Stoichiometry Materials with a High-Throughput Ab-Initio Approach
Chem. Mater. 28(18), 6484–6492 (2016)

Authors: Kesong Yang, [Corey Oses](#) & Stefano Curtarolo

Abstract: Predicting material properties of off-stoichiometry systems remains a long-standing and formidable challenge in rational materials design. A proper analysis of such systems by means of a supercell approach requires the exhaustive consideration of all possible superstructures, which can be a time-consuming process. On the contrary, the use of quasirandom approximants, although very computationally effective, implicitly bias the analysis toward disordered states with the lowest site correlations. Here, we propose a novel framework designed specifically to investigate stoichiometrically driven trends of disordered systems (i.e., having partial occupation and/or disorder in the atomic sites). At the heart of the approach is the identification and analysis of unique supercells of a virtually equivalent stoichiometry to the disordered material. We employ Boltzmann statistics to resolve system-wide properties at a high-throughput (HT) level. To maximize efficiency and accessibility, we integrated the method within the automatic HT computational framework AFLOW. As proof of concept, we apply our approach to three systems of interest, a zinc chalcogenide (ZnS_{1-x}Se_x), a wide-gap oxide semiconductor (Mg_xZn_{1-x}O), and an iron alloy (Fe_{1-x}Cu_x), at various stoichiometries. These systems exhibit properties that are highly tunable as a function of composition, characterized by optical bowing and linear ferromagnetic behavior. Not only are these qualities successfully predicted, but additional insight into underlying physical mechanisms is revealed.

Accelerated discovery of new magnets in the Heusler alloy family

Authors: Stefano Sanvito, [Corey Oses](#), Junkai Xue, Anurag Tiwari, Mario Zic, Thomas Archer, Pelin Tozman, Munuswamy Venkatesan, J. Michael D. Coey & Stefano Curtarolo

Abstract: Magnetic materials underpin modern technologies, ranging from data storage to energy conversion to contact-less sensing. However, the development of a new high-performance magnet is a long and often unpredictable process, and only about two dozen feature in mainstream applications. Here we describe a systematic pathway to the discovery of novel magnetic materials, which demonstrates an unprecedented throughput and discovery speed. Based on an extensive electronic structure library of Heusler alloys containing 236,115 prototypical compounds, we have filtered those alloys displaying magnetic order and established whether they can be fabricated at thermodynamical equilibrium. Specifically, we have carried out a full stability analysis for intermetallic Heusler alloys made only of transition metals. Among the possible 36,540 prototypes, 248 are found thermodynamically stable but only 20 are magnetic. The magnetic ordering temperature, T_C , has then been estimated by a regression calibrated on the experimental T_C of about 60 known compounds. As a final validation we have attempted the synthesis of a few of the predicted compounds and produced two new magnets. One, Co_2MnTi , displays a remarkably high T_C in perfect agreement with the predictions, while the other, Mn_2PtPd , is an antiferromagnet. Our work paves the way for large-scale design of novel magnetic materials at unprecedented speed.

The AFLOW Standard for High-Throughput Materials Science Calculations Comput. Mater. Sci. **108A**, 233–238 (2015)

Authors: Camilo E. Calderon, Jose J. Plata, Cormac H. Toher, [Corey Oses](#), Ohad Levy, Marco Fornari, Amir Natan, Michael J. Mehl, Gus L. W. Hart, Marco Buongiorno Nardelli & Stefano Curtarolo

Abstract: The Automatic-Flow (AFLOW) standard for the high-throughput construction of materials science electronic structure databases is described. Electronic structure calculations of solid state materials depend on a large number of parameters which must be understood by researchers, and must be reported by originators to ensure reproducibility and enable collaborative database expansion. We therefore describe standard parameter values for k-point grid density, basis set plane wave kinetic energy cut-off, exchange-correlation functionals, pseudopotentials, DFT+U parameters, and convergence criteria used in AFLOW calculations.

Materials Cartography: Representing and Mining Materials Space Using Structural and Electronic Fingerprints

Chem. Mater. **27**(3), 735–743 (2015)

Authors: Olexandr Isayev, Denis Fourches, Eugene N. Muratov, [Corey Oses](#), Kevin M. Rasch, Alexander Tropsha & Stefano Curtarolo

Abstract: As the proliferation of high-throughput approaches in materials science is increasing the wealth of data in the field, the gap between accumulated-information and derived-knowledge widens. We address the issue of scientific discovery in materials databases by introducing novel analytical approaches based on structural and electronic materials fingerprints. The framework is employed to (i) query large databases of materials using similarity concepts, (ii) map the connectivity of materials space (i.e., as a materials cartograms) for rapidly identifying regions with unique organizations / properties, and (iii) develop predictive Quantitative Materials Structure-Property Relationship models for guiding materials design. In this study, we test these fingerprints by seeking target material properties. As a quantitative example, we model the critical temperatures of known superconductors. Our novel materials fingerprinting and materials cartography approaches contribute to the emerging field of materials informatics by enabling effective computational tools to analyze, visualize, model, and design new materials.
